Subject: [EXTERNAL]Armistead Boothe concerns

Good morning, my concerns with the conversion are the encroachment on the RPA, especially in a flood plain. Also, due to flooding in Alexandria the potential runoff from removing a pervious surface.

Finally, can the City share any data with regards to injuries on other synthetic fields?
Thank you

Subject: [EXTERNAL]Two Quick Questions + One

Jack,

Did you tell me in an earlier phone call that the Federal Stimulus Funds could not be used to repair the Holmes Run Trail damage, from the Van Dorn/I-395 tunnels upstream all the way to the Chamblis Crossing? Someone asked me about the possibility if those funds could be used and I had a faint memory that you told me those funds couldn't be used like that.

Who do I talk to about the actual plans for the proposed synthetic field installation at Boothe Park? I know this will be part of this month's P&R Commission Meeting on Thursday. My questions are what type of material is used for the crumb fill, after the water is collected/drained off of the field, is there any kind of BMP treatment or does the water go directly into Backlick Run, have water quality tests been done on Backlick Run just upstream to have a baseline measurement of data? Who is the best person to talk to, to get these kinds of questions answered?

And I forgot the question my n'hood has been asking, what's the best remediation of the mud puddles and lack of drainage for the dirt road trail entrance from S Gordon into lower Tarleton Park? Is that a parks question or a T&ES contact? And do you know that person by name? So I know how to contact them for the questions? Someone commented that too large a gravel size was used last year and the results were unsatisfactory. Reminds me of my FEMA days; do you use what's on hand, in stock or do you go out and buy what you need? As in use the correct material?

Thanks for any "pointing" you can do.

Kind regards,

Elizabeth Wright
